1. TEST RESULT CERTIFICATION

Product:	Defense Monitor
Model:	TDM-D240
Brand:	ELGENS
Applicant:	**ELGENS CO., LTD** 7 F.-6, No. 492, Bannan Rd., Zhonghe Dist., New Taipei City 235602, Taiwan (R.O.C.)
Manufacturer:	**ELGENS CO., LTD** 7 F.-6, No. 492, Bannan Rd., Zhonghe Dist., New Taipei City 235602, Taiwan (R.O.C.)
Tested:	August 11 ~ 13, 2025
Received Date:	August 04, 2025

Standards	
MIL-STD-1275E	
Applicable Standard	**Test Result**
5.3.1 Steady state operation	Pass
5.3.2 Starting operation	Pass
5.3.3.1.1 Transient disturbances – Injected voltage spikes	Pass
5.3.3.1.2 Transient disturbances – Emitted voltage spikes	Pass
5.3.3.2.1 Transient disturbances – Injected voltage surges	Pass
5.3.3.2.2 Transient disturbances – Emitted voltage surges	Pass
5.3.4 Reverse polarity	Pass
Deviation from Applicable Standard	
N/A	
Statements of Conformity	
Determination of compliance is based on the results of the compliance measurement, not taking into account measurement instrumentation uncertainty.	

This document cannot be reproduced except in full, without prior written approval of the Company. 本報告未經本公司書面許可，不可部份複製。

The above equipment was tested by Compliance Certification Services Inc. for compliance with the requirements set forth in MIL STD 1275E. The results of testing in this report apply only to the product/system, which was tested. Other similar equipment will not necessarily produce the same results due to production tolerance and measurement uncertainties.

Approved by:

Sam Zeng
Asst. Section Manager
Compliance Certification Services Inc.

This document cannot be reproduced except in full, without prior written approval of the Company. 本報告未經本公司書面許可，不可部份複製。

2. EUT DESCRIPTION

Product	Defense Monitor
Brand Name	ELGENS
Model	TDM-D240
Series Model	N/A
Model Discrepancy	N/A
Applicant	ELGENS CO., LTD

Remark: For more details, please refer to the User's manual of the ESA.

3. TEST METHODOLOGY

All tests were performed in accordance with the procedure documented in MIL STD 461G.

4. INSTRUMENT AND CALIBRATION

4.1 MEASURING INSTRUMENT CALIBRATION

The measuring equipment, which was utilized in performing the tests documented herein, has been calibrated in accordance with the manufacturer's recommendations for utilizing calibration equipment, which is traceable to recognized national standards.

4.2 MEASUREMENT EQUIPMENT USED

Equipment Used for Voltage compatibility verification method

Transients And Surge In The Vehicular Environment Test Site

5. FACILITIES AND ACCREDITATIONS

5.1 FACILITIES

All measurement facilities used to collect the measurement data are located at

☒ No.11, Wugong 6th Rd., Wugu Dist., New Taipei City, Taiwan.

Tel: 886-2-2299-9720 / Fax: 886-2-2299-9721

The sites are constructed in conformance with the requirements of ANSI C63.7, ANSI C63.4 and CISPR Publication 22.

6. SETUP OF EQUIPMENT UNDER TEST

6.1 SETUP CONFIGURATION OF EUT

See test photographs attached in Appendix I for the actual connections between EUT and support.

6.2 PHOTOGRAPHS OF EUT

See test photographs attached in Appendix II for the EUT's external structure.

6.3 SUPPORT EQUIPMENT

No.	Device Type	Brand	Model	Series No.	FCC ID	Data Cable	Power Cord
1	Notebook	HP	HSN-Q35C-4	5CD3064W7Y	NA	NA	NA

Remarks:

1. *All the above equipment/cables were placed in worse case positions to maximize emission signals during emission test.*
2. *Grounding was established in accordance with the manufacturer's requirements and conditions for the intended use.*

6.4 TEST SETUP

The equipment under test connects to notebook and test instrument, then type the character "H" during test.

This document cannot be reproduced except in full, without prior written approval of the Company. 本報告未經本公司書面許可，不可部份複製。

7. MIL STD 1275E REQUIREMENTS

7.1 STEADY STATE OPERATION

APPLICABILITY

This section describes the steady state voltage range, which excludes engine starting disturbances, and applies to all utilization equipment. Utilization equipment shall operate without degradation or damage when subjected to the operational voltage range specified in this section.

TEST

Operational voltage range

The utilization equipment voltage operating range is between 20 VDC and 33 VDC, including ripple.

Voltage ripple

The maximum peak-to-peak ripple voltage limits are specified in MIL-STD-461 CS101 with the same values used at 150 kHz extended to 250 kHz, as shown in Figure 1.

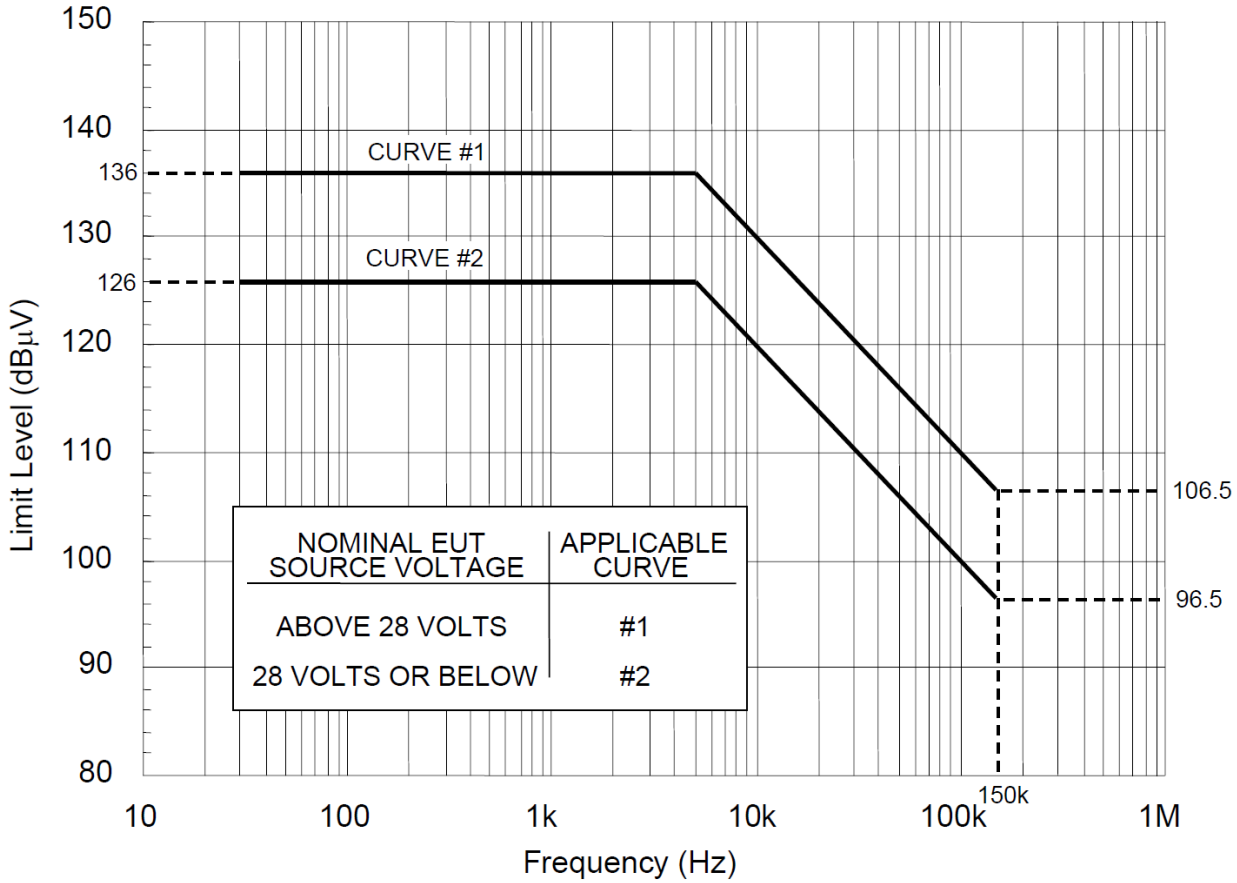

FIGURE 1. CS101 voltage limit for all applications

This document cannot be reproduced except in full, without prior written approval of the Company. 本報告未經本公司書面許可，不可部份複製。

TEST CONFIGURATION

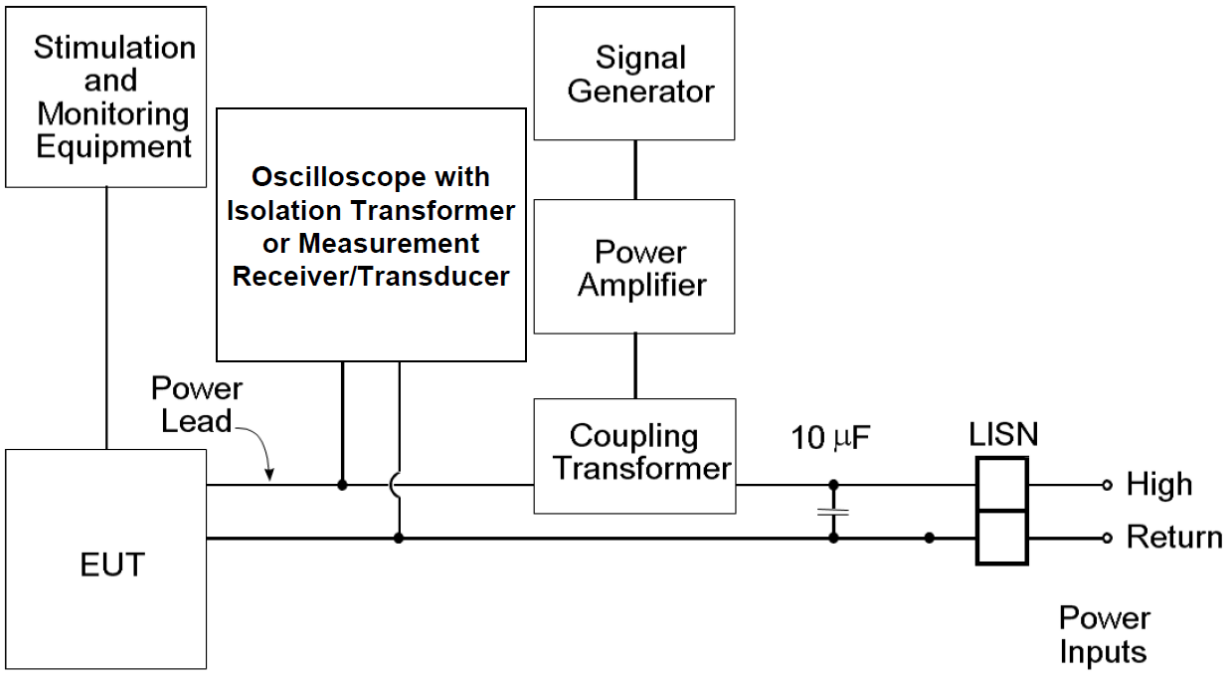

FIGURE 2. Test set-up to Voltage ripple

TEST PROCEDURE

The magnetic emission of EUT representative of its type shall be tested by the method(s) according to MIL STD 1275E.

This document cannot be reproduced except in full, without prior written approval of the Company. 本報告未經本公司書面許可，不可部份複製。

TEST RESULTS

Pass

Operational voltage range

EUT Power	Test Lines	Test Level	Limit	Test Result	Pass/ Fail
28V	Power lines	20V	Any deviation from normal operation shall be recognized as a failure of the EUT.	During and after test, EUT function is normal.	Pass
		33V		During and after test, EUT function is normal.	Pass

Voltage ripple

EUT Power	Test Lines	Test Curve(#)	Limit	Test Result	Pass/ Fail
28	Power lines	2	Any deviation from normal operation shall be recognized as a failure of the EUT.	During and after test, EUT function is normal.	Pass

7.2 STARTING OPERATION.

APPLICABILITY

This section applies to utilization equipment operating while subjected to engine starting disturbances. Utilization equipment shall operate without degradation or damage when subjected to engine starting disturbances within the limits shown in Figure 4.

TEST

Initial engagement surge (IES)
The minimum voltage supplied to utilization equipment during an IES is 12 VDC. The maximum duration of the IES is one (1) second. Consecutive IES events are a minimum of one (1) second apart.

A starting disturbance is the variation in system voltage from the normal operating voltage range caused by the initial engagement of the engine starter and subsequent engine cranking. The duration of the Initial Engagement Surge (IES) is measured from the time at which it departs from the normal operating voltage to the time at which it reaches and remains at the cranking voltage. An example showing “Initial Engagement Surge” (IES) and “Cranking”; i.e., voltage level during active engine cranking is shown in Figure 3.

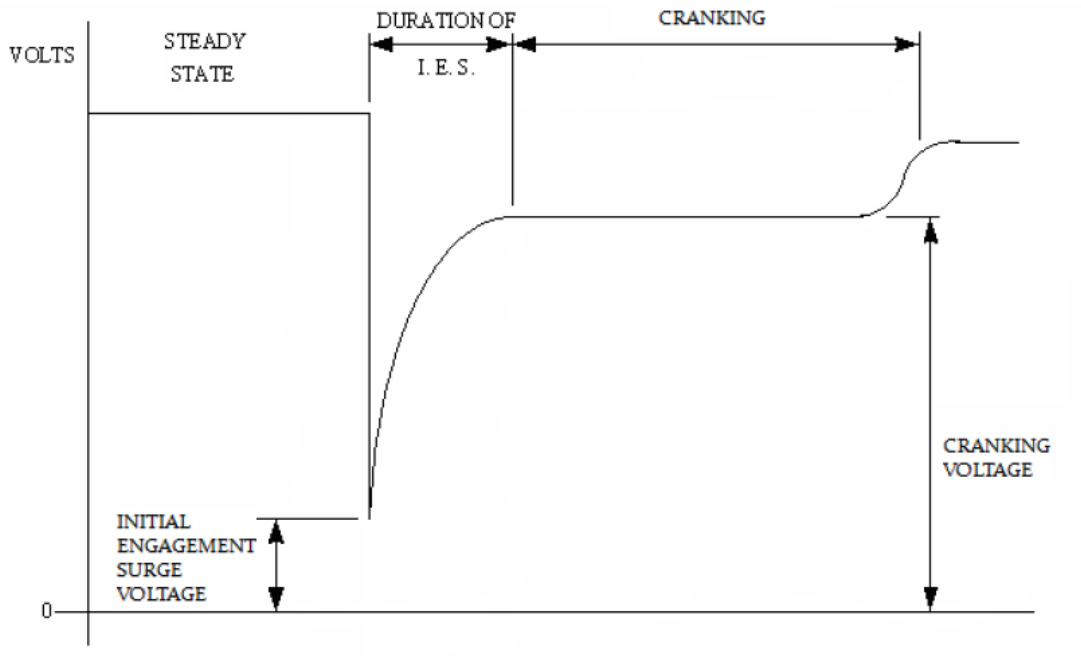

Figure 3. Sample starting disturbance waveform

This document cannot be reproduced except in full, without prior written approval of the Company. 本報告未經本公司書面許可，不可部份複製。

Cranking surges

The minimum voltage supplied to utilization equipment during cranking surges is 16 VDC. The maximum duration of cranking surges is thirty (30) seconds.

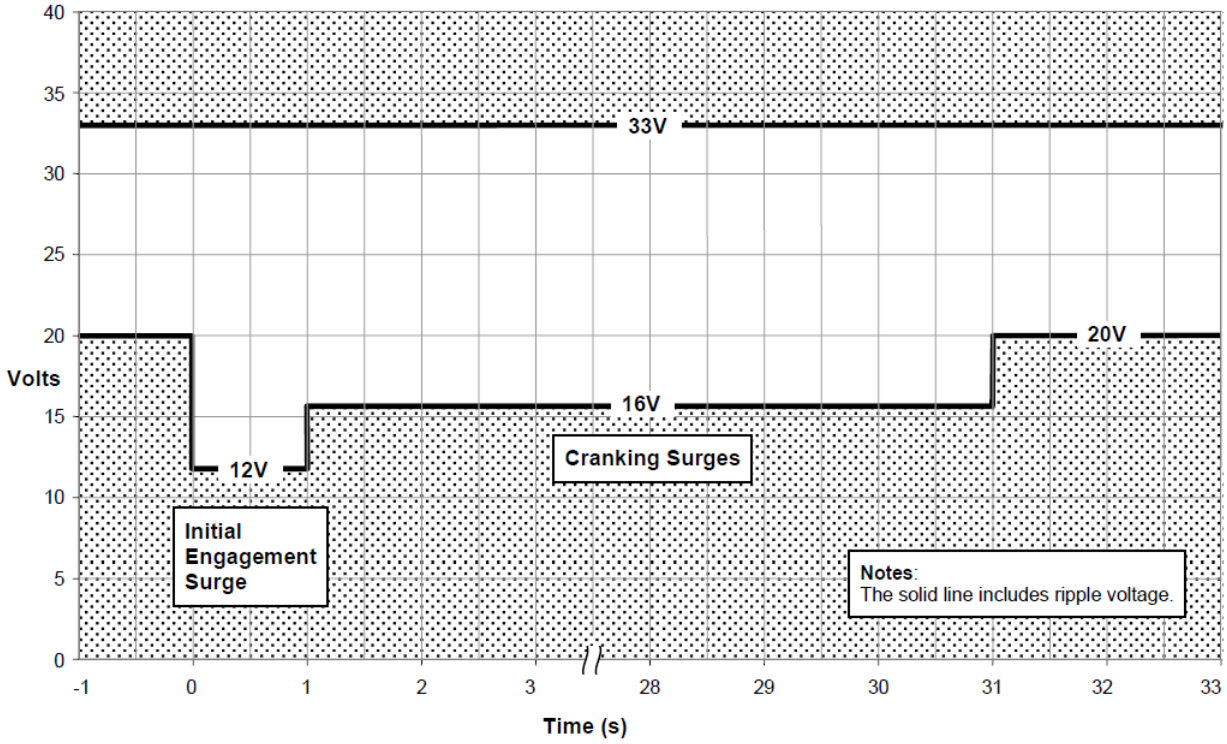

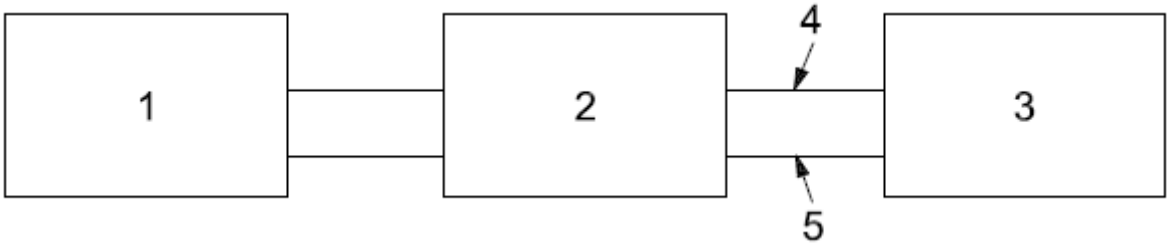

Figure 4. Starting disturbance limits on 28VDC systems

7.3 TRANSIENT DISTURBANCES_ IINJECTED VOLTAGE SPIKES

APPLICABILITY

Utilization equipment shall operate without degradation or damage when subjected to voltage spikes within the limits shown in Figure 6. The maximum rise time (t_{RISE}) of the injected spikes is 50 nanoseconds, and the maximum total energy content of a single spike is 2 Joules.

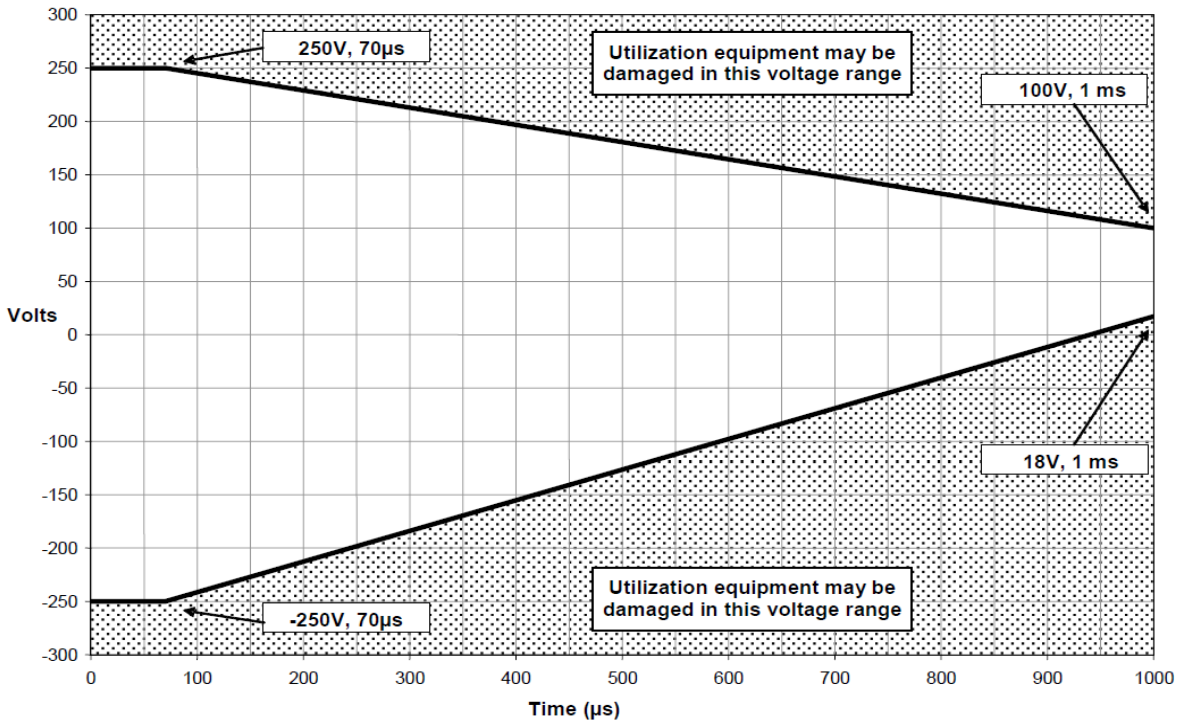

Figure 6. Envelope of spikes for 28VDC systems.

TEST

The EUT shall be supplied power by a voltage source set to the nominal 28 VDC operating voltage through a Line Impedance Stabilization Network (LISN). The test operator shall inject voltage spikes into the EUT using a test setup similar to Figure 7.

One LISN shall be used when the power return is the vehicle chassis; in this case the ground plane provides the power return current path. Two LISNs shall be used when the EUT has a dedicated power return conductor, such as wires, buss bar, etc. This simulates the additional vehicle wiring harness present in the vehicle.

Both positive and negative voltage spikes shall be applied to the EUT. A minimum of fifty (50) 250V spikes of each polarity shall be applied at one (1) second intervals. Each test spike shall have a peak amplitude of 250V, a risetime not exceeding 50 ns, a frequency of oscillation greater than 100 kHz and less than 500 kHz, and a maximum energy content of 2 Joules.
Verify the EUT operates as specified while subjected to the voltage spikes. Any deviation from normal operation shall be recognized as a failure of the EUT.

This document cannot be reproduced except in full, without prior written approval of the Company. 本報告未經本公司書面許可，不可部份複製。

TEST CONFIGURATION

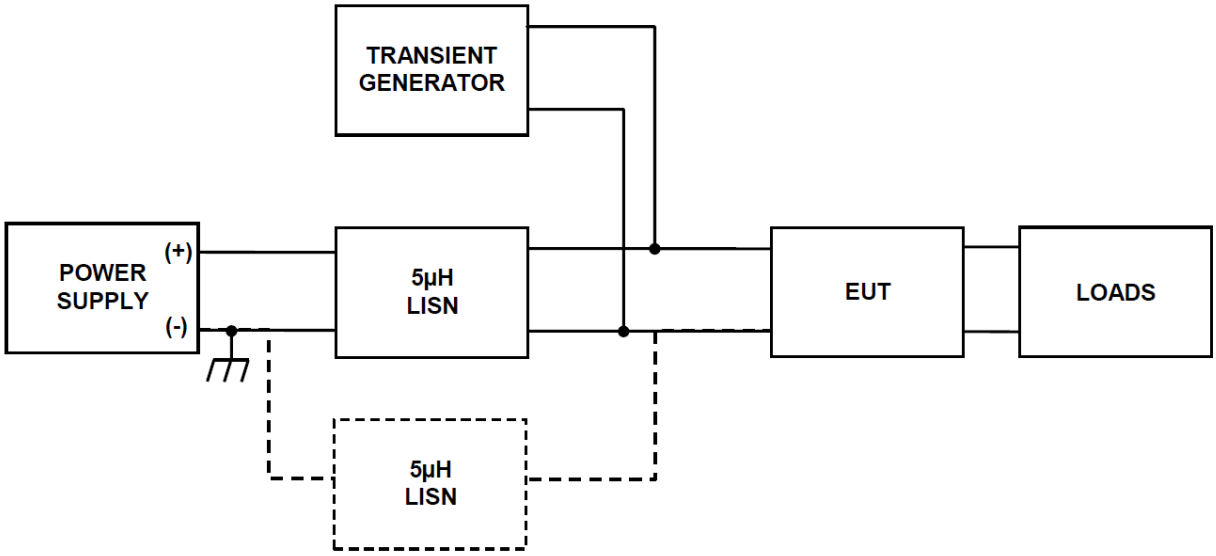

Figure 7. Sample test setup for immunity to injected voltage spikes

TEST PROCEDURE

The magnetic emission of EUT representative of its type shall be tested by the method(s) according to MIL STD 1275E.

TEST RESULTS

Pass

Test Pulse	Test Voltage (V)	Limit	Test Result	Pass / Fail
Positive Spike	+250	Any deviation from normal operation shall be recognized as a failure of the EUT.	During and after test, EUT function is normal.	Pass
Negative spike	-250	Any deviation from normal operation shall be recognized as a failure of the EUT.	During and after test, EUT function is normal.	Pass

7.4 TRANSIENT DISTURBANCES_ EMITTED VOLTAGE SPIKES

APPLICABILITY

Emitted voltage spikes from utilization equipment shall be within the limits shown in Figure 8. The maximum total energy content of a single emitted spike is 125 millijoules (mJ).

TEST

The EUT shall be supplied power by a source set to the nominal 28 VDC operating voltage. Unless otherwise specified in the applicable performance specification, use the conducted transient emissions test method specified in SAE J1113-42 to measure the spikes emitted by the EUT using a test setup similar to Figure 9.

One LISN shall be used when the power return is the vehicle chassis; in this case the ground plane provides the power return current path. Two LISNs shall be used when the EUT has a dedicated power return conductor, such as wires, buss bar, etc. This simulates the additional vehicle wiring harness present in the vehicle.
The test operator shall exercise switching function(s) of the EUT capable of producing spikes, (e.g., the switching of any inductive loads controlled by the EUT). If the power source to the EUT is controlled by means of a vehicle mounted switch or relay, the test shall be performed using this switch or relay. Each switching function shall be exercised a minimum of thirty-two (32) times in order to give a reasonable probability that the maximum spike voltage is recorded. The test operator shall monitor the operation of the EUT. Voltage spikes emitted by the EUT shall be within the limits shown in Figure 8. Any voltage spike or combination of voltage spikes emitted from a single event shall have an energy content less than 125 mJ.

7.5 TRANSIENT DISTURBANCES_INJECTED VOLTAGE SURGES

APPLICABILITY

Utilization equipment shall operate without degradation or damage when subjected to voltage surges within the limits shown in Figure 10. The maximum total energy content of a single surge is 60 Joules (J).

LIMIT

The test operator shall inject voltage surges into the EUT using a test setup similar to Figure 10.

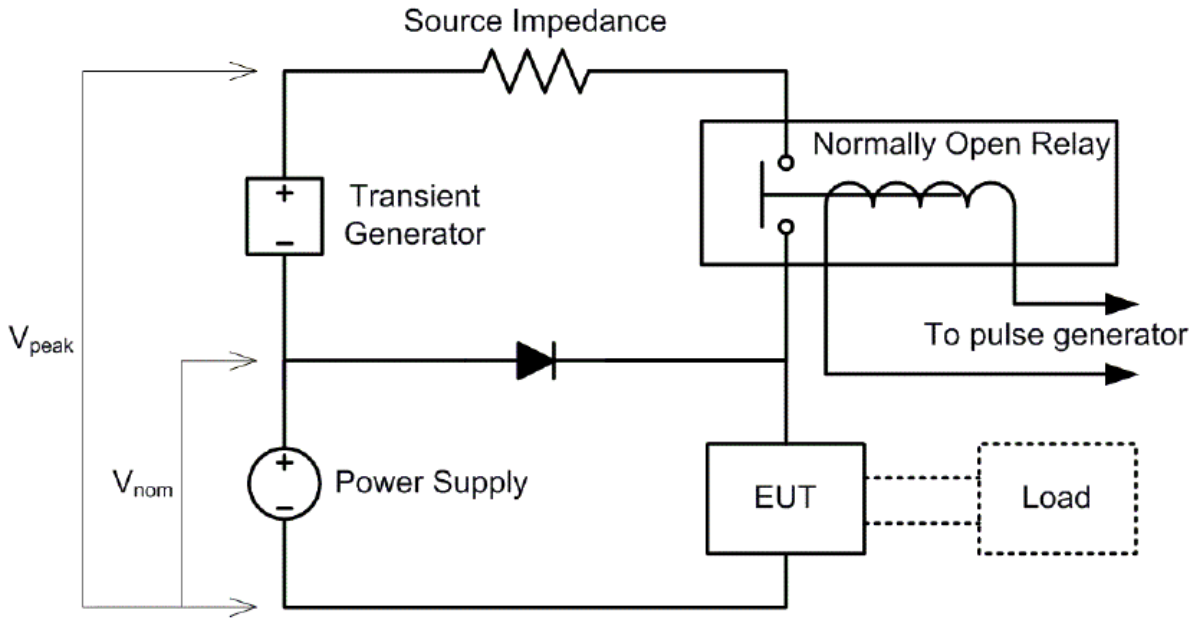

Figure 10. Sample test circuit for immunity to injected voltage surges

The voltage waveform injected on the power line(s) of the EUT shall simulate the voltage surge shown in Figure 11. The voltage surge parameters are shown in Table 1. Energy emitted from the transient surge generator shall be limited to 60 Joules.

Table 1. Positive voltage surge test parameters.

Operating Voltage (V_{nom})	Amplitude (V_{peak})	Rise Time (ms)	Duration (ms)	Source Impedance (mΩ)	Number of Pulses	Time Between Pulses (s)
30 -0/+1	100 -0/+10	1 < t < 10	50 -0/+5	500 -25/+0	5	15

Prior to connection of the EUT, the test operator shall verify the amplitude and duration of the voltage surge specified in Table I with a non-inductive load whose resistance is matched to the source impedance of the transient generator.
Verify the EUT operates as specified while subjected to the voltage surges. Any deviation from normal operation shall be recognized as a failure of the EUT.

7.7 REVERSE POLARITY

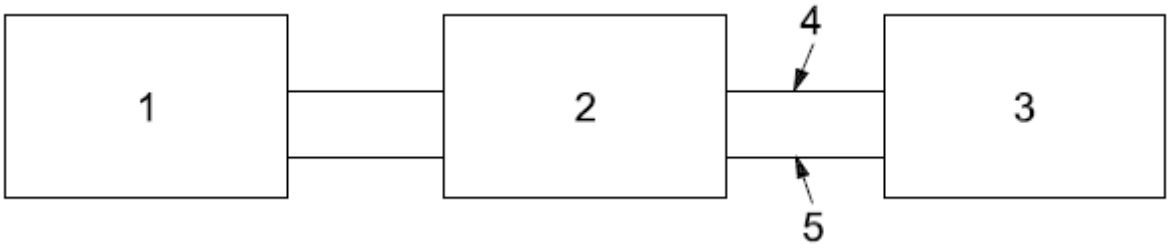

APPLICABILITY

Utilization equipment shall protect itself against damage due to input power with reverse polarity. With reverse polarity voltage applied to the input power terminals of the utilization equipment, the magnitude of the reverse polarity input current shall be equal to or less than the magnitude of the utilization equipment normal operating current.

TEST

Connect the positive (+) terminal of the EUT to the negative (-) terminal of the power supply system. Connect the negative (-) terminal of the EUT to the positive (+) terminal of the power supply system. Set the voltage on the power supply to 33 VDC and leave connected for five (5) minutes. Connect EUT input terminals to power with the correct polarity and verify device operates as specified. Any deviation from normal operation shall be recognized as a failure of the EUT.

TEST CONFIGURATION
